AI Tender Qualification Assistant

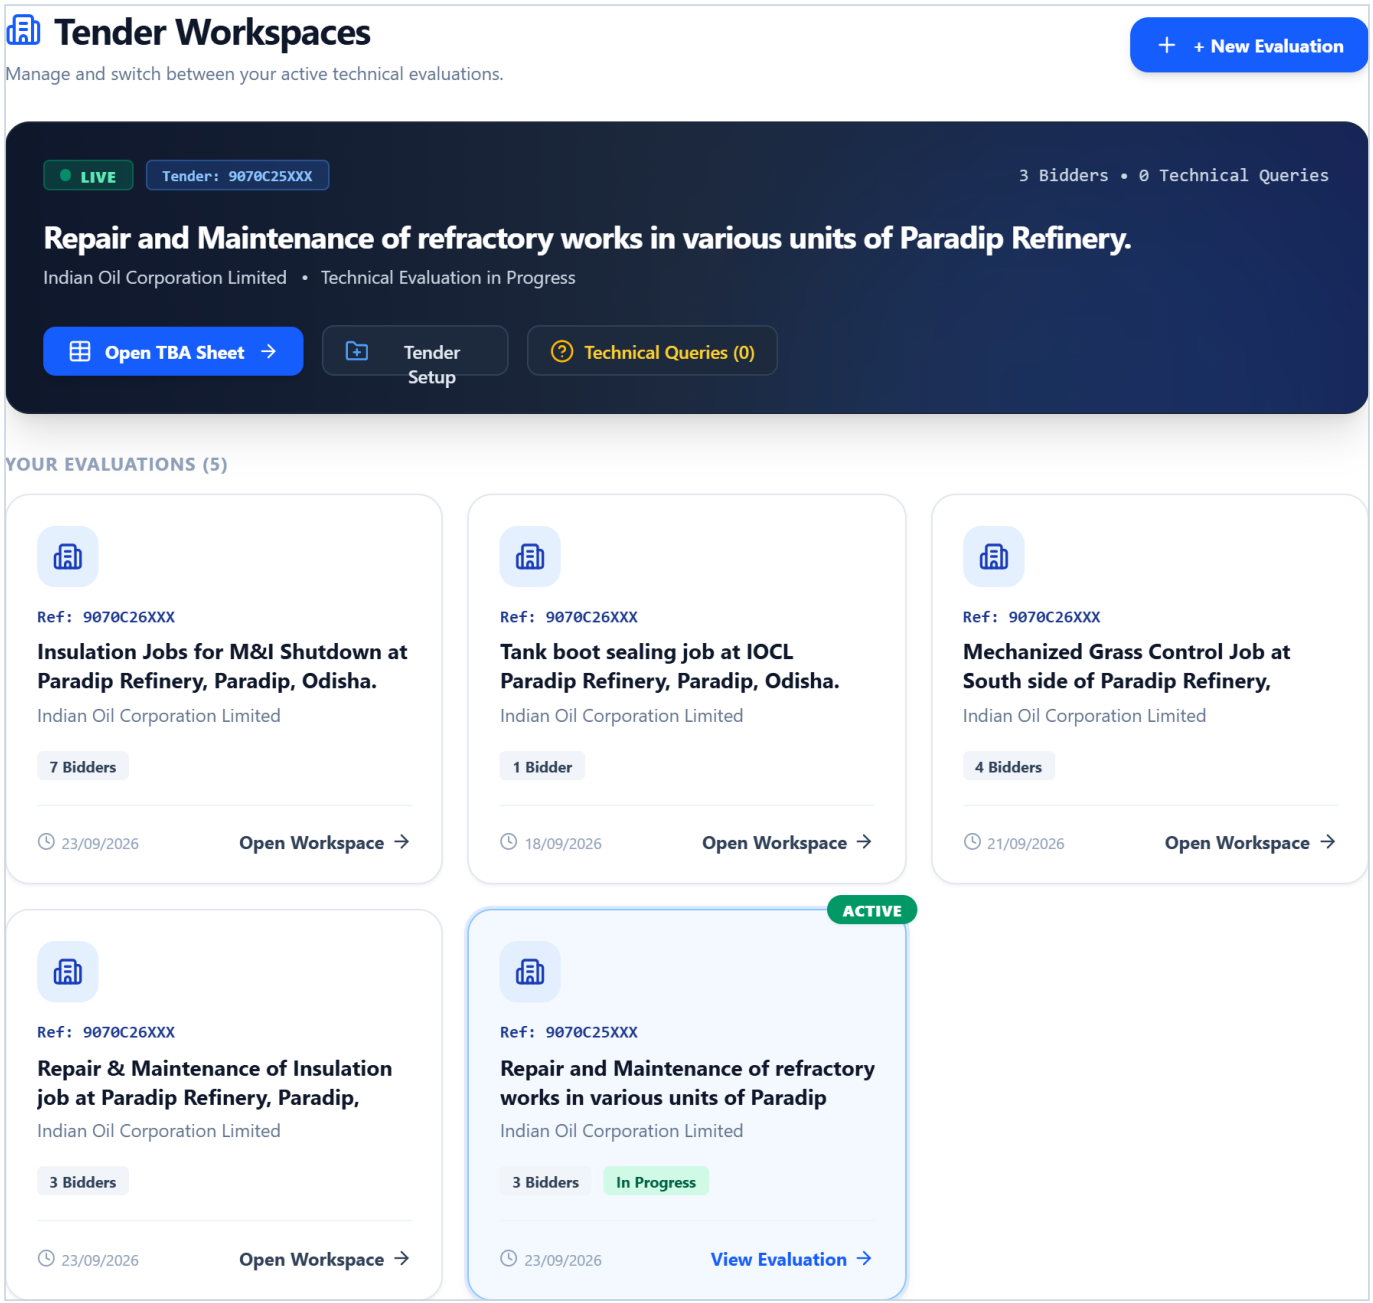

A walk through the working prototype

Every screen in this document is the live application, captured while evaluating a real tender: 9070C25XXX, "Repair and Maintenance of refractory works in various units of Paradip Refinery" — an ARC tender with 3 bidders and 15 work orders between them. Nothing here is a mock-up.

The evaluation is still open, so the participants are shown as Bidder A, B and C and the last few digits of the tender and work-order numbers are masked. Values, dates, clauses and remarks are exactly as the application produced them.

The workspace

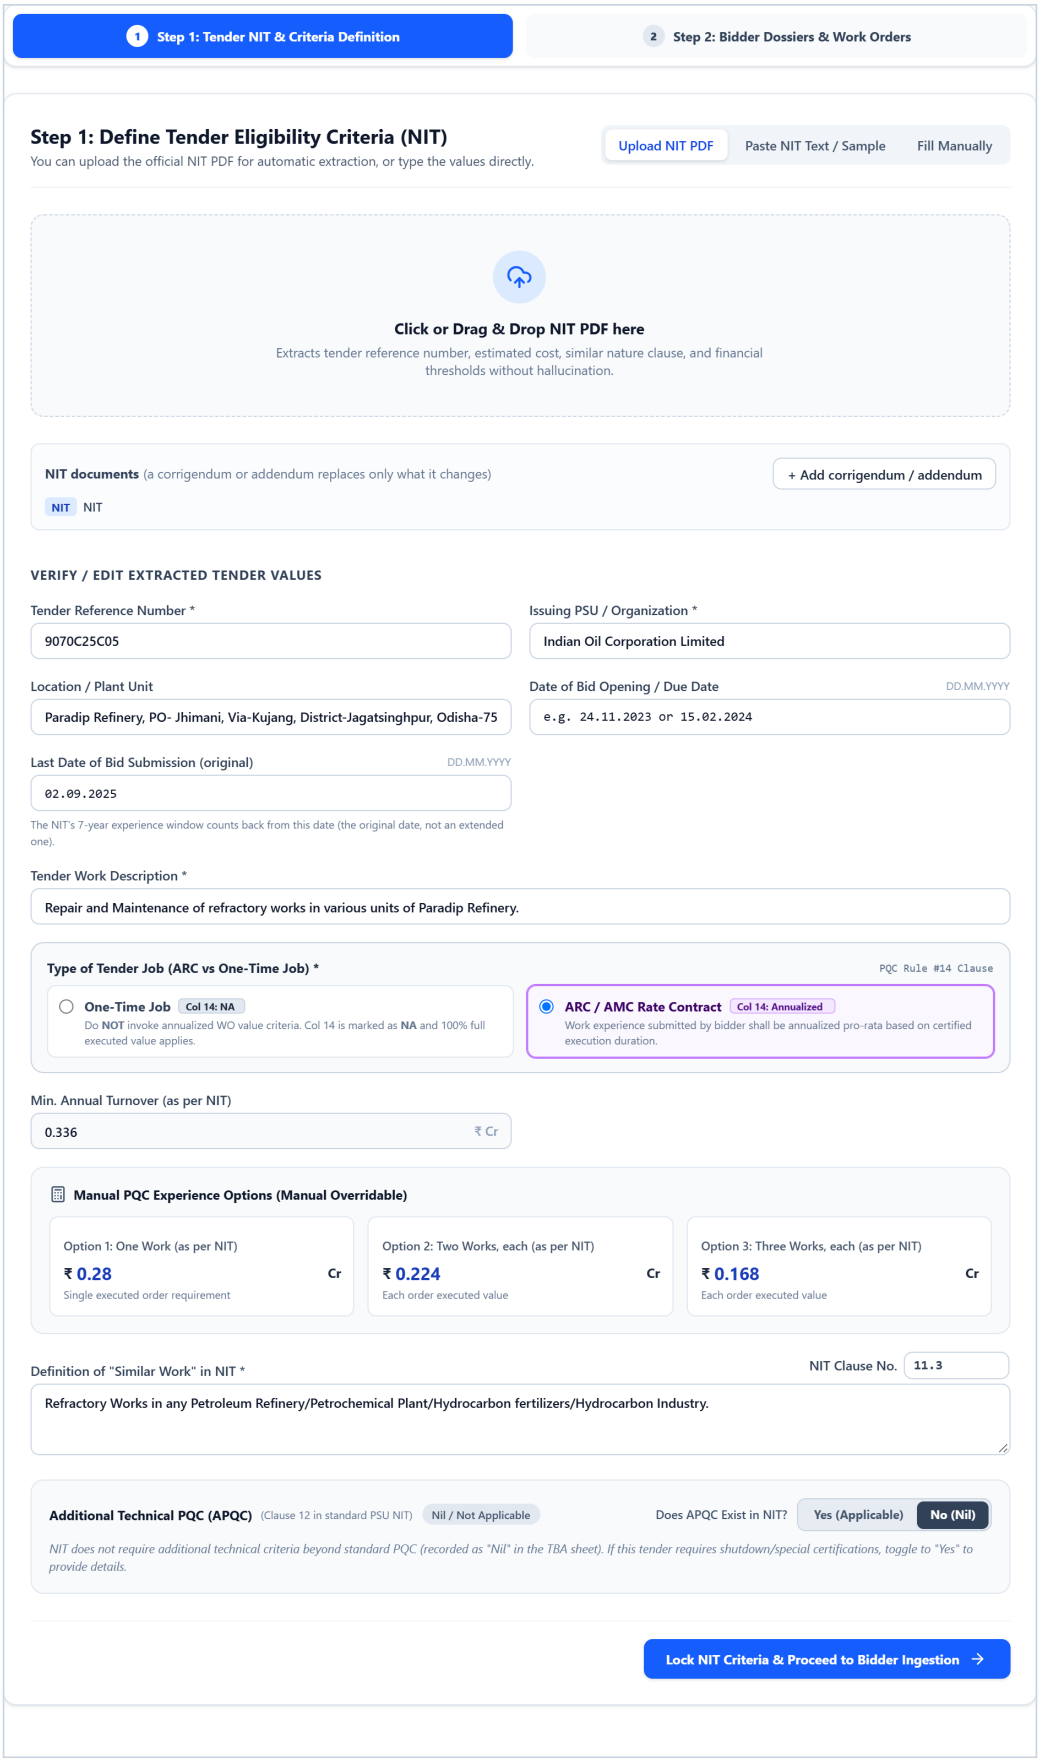

Each tender is a workspace an evaluator opens and shares with the team. The one in the banner is live; the cards below it are the other evaluations running in parallel.

1. The NIT is the configuration

The engineer uploads the tender's own NIT. The app reads the qualifying values, the similar-nature definition, the experience window and the ARC flag from that document — no thresholds are written into the software, so the second tender does not need a new release.

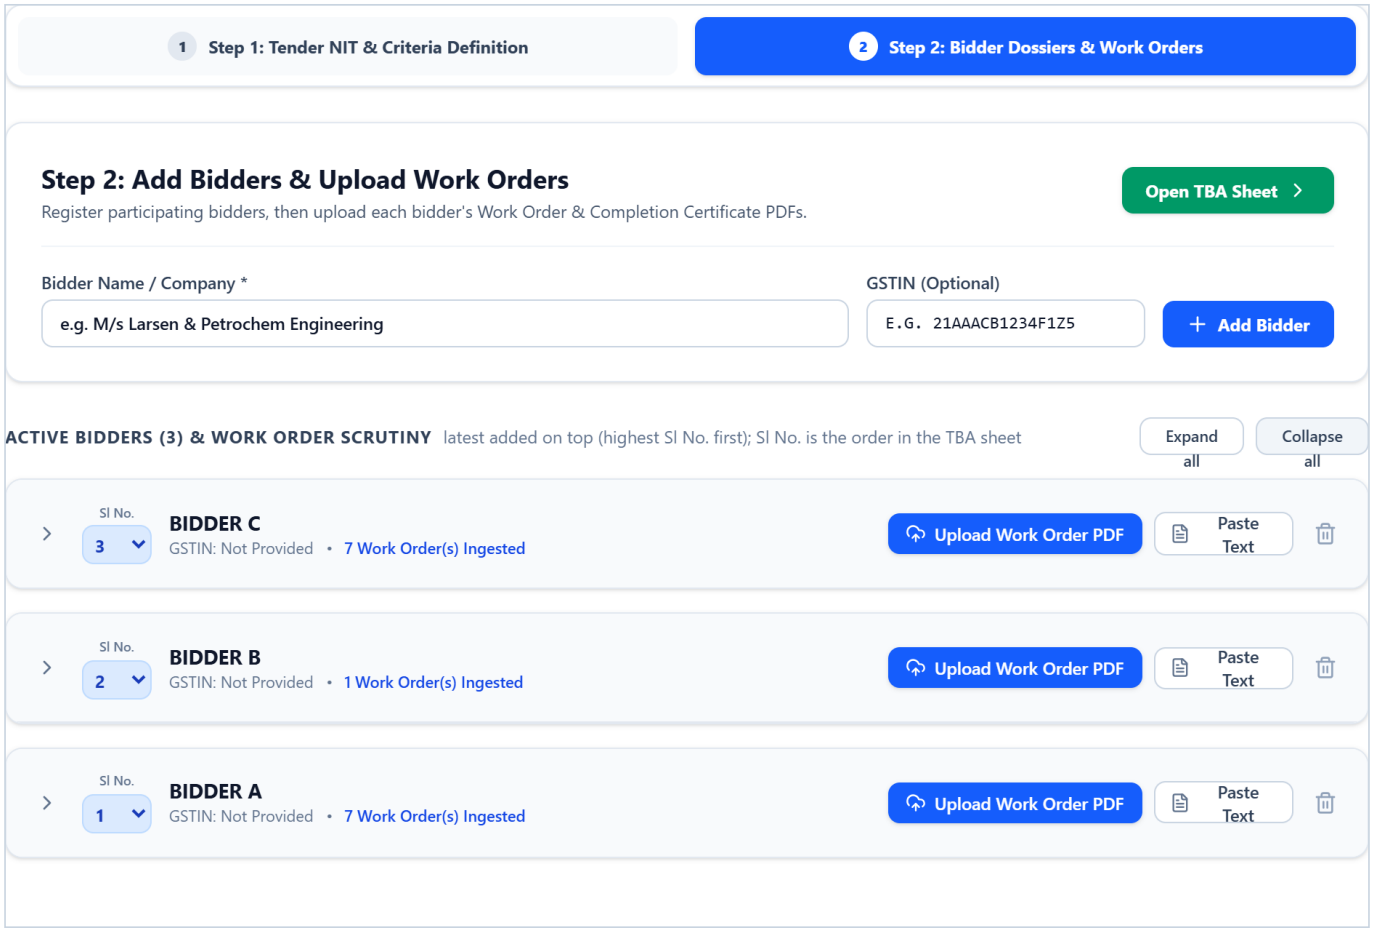

A corrigendum or addendum is uploaded on top of the NIT and replaces only what it actually changes. The original date of bid submission is never moved by it, because the 7-year experience window is counted back from that date.

2. Bidders and their dossiers

Each bidder is added once, then their credential PDFs are uploaded — work orders, completion certificates, performance statements, CA certificates, in whatever order they arrive. Scanned pages need no separate OCR step.

The newest bidder stays at the top, the Sl No. selector fixes the order used in the TBA sheet, and every bidder can be collapsed so a dossier of thirty work orders does not bury the next one.

3. What the app read from THIS NIT

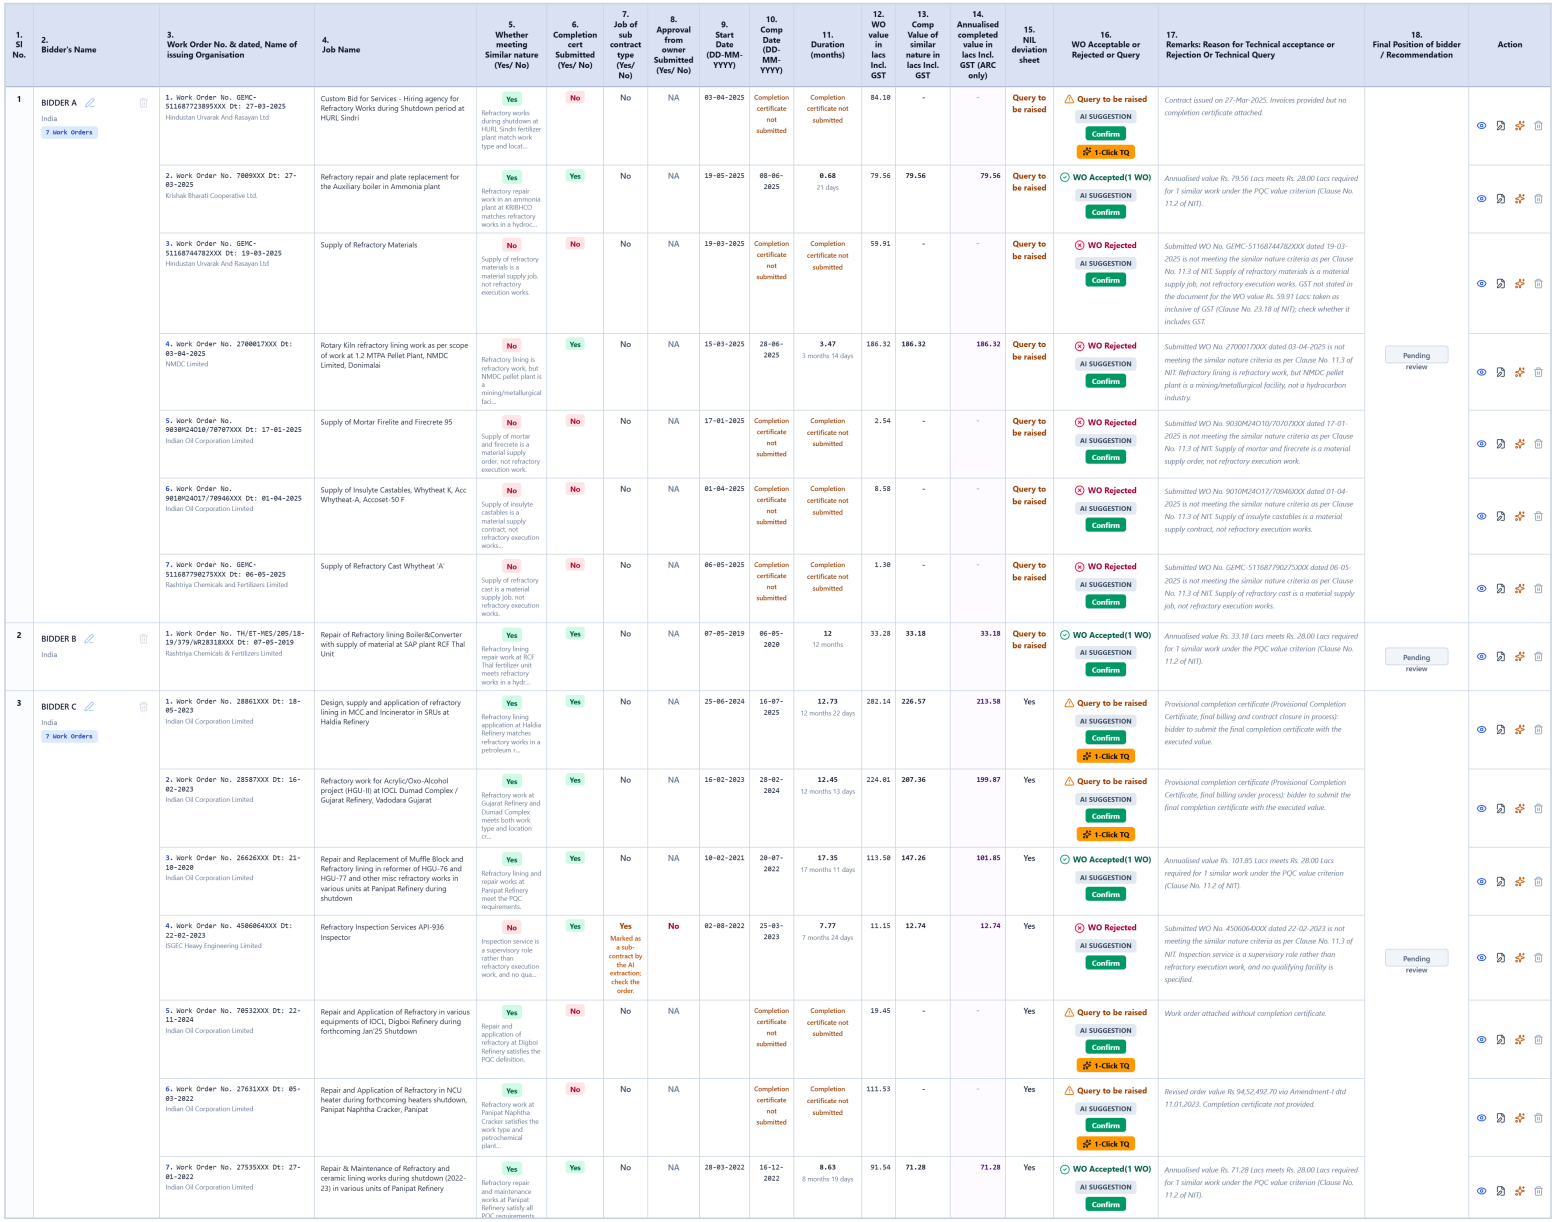

The PQC values (Rs. 28.00 / 22.40 / 16.80 Lacs), the similar-nature definition, the annualisation rule for ARC jobs and the experience window (01-09-2018 to 31-08-2025, counted back from the last date of bid submission) all come from this tender's NIT, with the clause number kept against each one.

Fourteen clauses were read here and three of them allow a relaxation. A relaxation is never applied silently: it is shown to the engineer, who decides. Clause numbers are never assumed either — a NIT that numbers its value criterion 10.2 instead of 11.2 works unchanged, because the rules match on the subject of the clause.

4. The committee's 18-column Technical Bid Analysis

This is the whole sheet for the tender: 3 bidders, 15 work orders, every column the committee's format requires. It is produced from the dossiers and the NIT, and it exports to Excel and to a print-ready PDF in the same layout.

1. Sl No.	2. Bidder's Name	3. Work Order No. & dated, Name of issuing Organisation	4. Job Name	5. Whether meeting Similar nature (Yes/ No)	6. Completion cert Submitted (Yes/ No)	7. 5. Reading the sheet — columns 1 to 9

Work orders are numbered within each bidder, so a sheet that runs over several printed pages still says which order is which. The bidder's name is a single merged cell against all of their rows.

Column 5 does not just say Yes or No on similar nature: it carries the reason, in the words of the job itself — "Supply of refractory materials is a material supply job, not refractory execution works."

1. Sl No.	2. Bidder's Name	3. Work Order No. & dated, Name of issuing Organisation	4. Job Name	5. Whether meeting Similar nature (Yes/ No)	6. Completion cert Submitted (Yes/ No)	7. Job of sub contract type (Yes/ No)	8. Approval from owner Submitted (Yes/ No)	9. Start Date (DD-MM-YYYY)	C I (M Y

6. Reading the sheet — columns 10 to 18

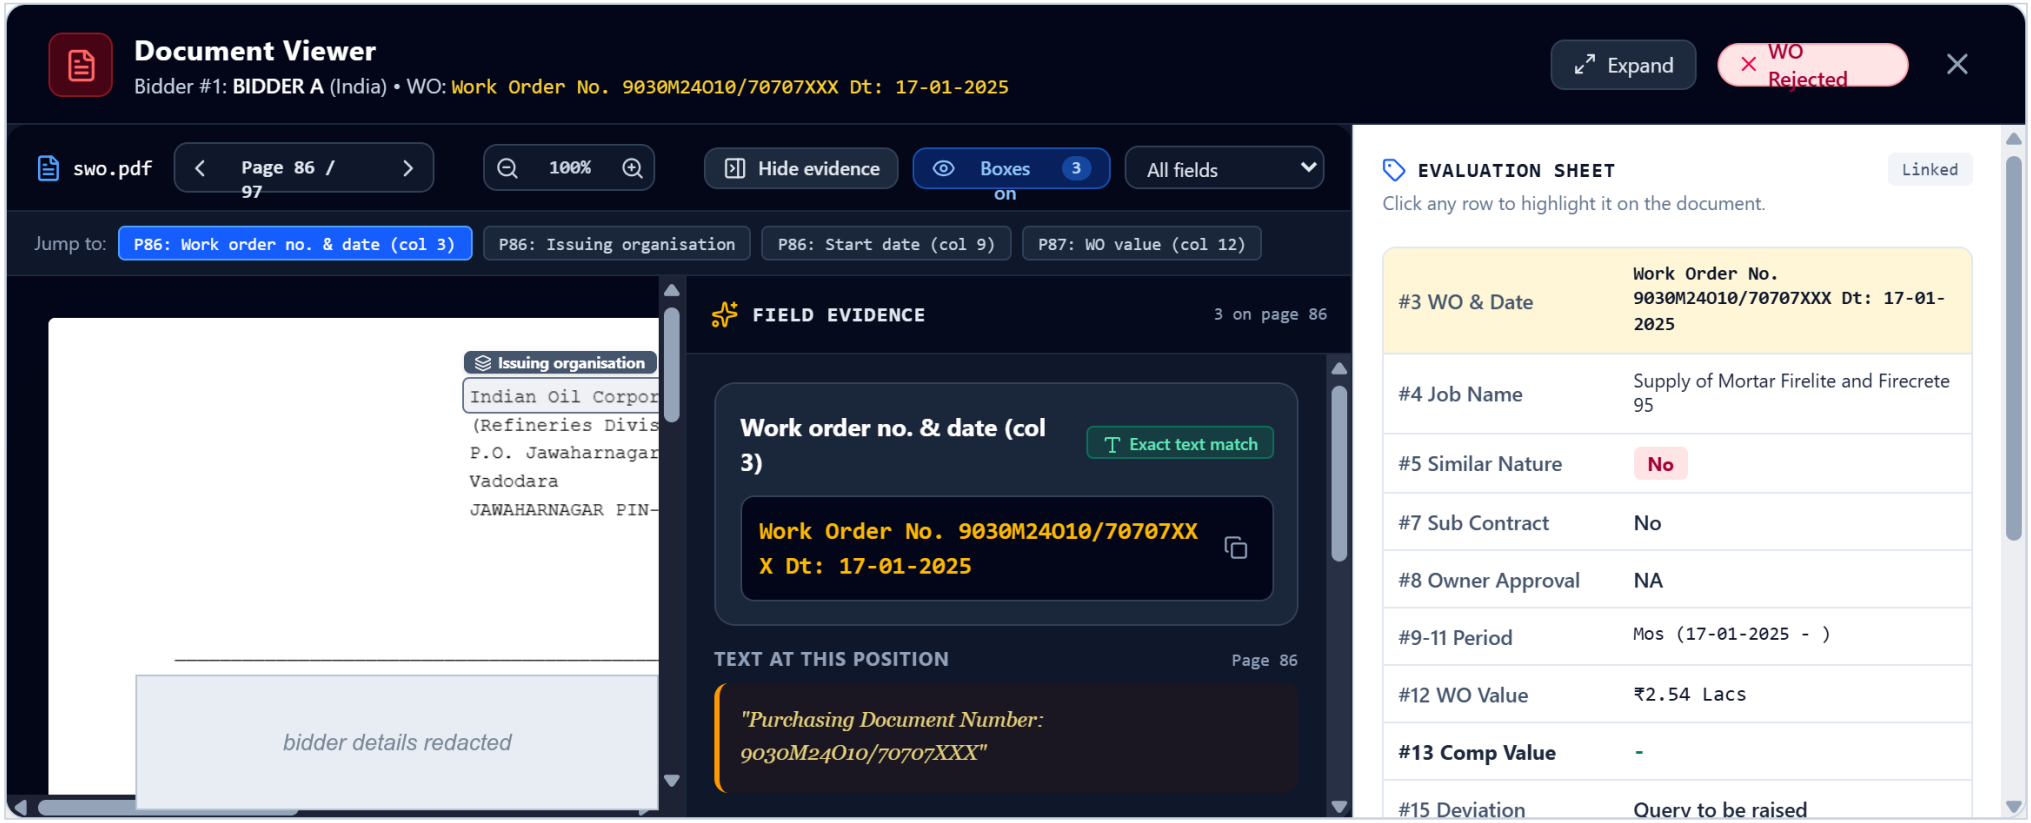

Three things worth looking at. Where no completion certificate was submitted, the completion date and the duration say exactly that, instead of showing a date the app guessed from elsewhere. Every remark cites the clause it rests on: "… meets Rs. 28.00 Lacs required for 1 similar work under the PQC value criterion (Clause No. 11.2 of NIT)". And where the document does not state whether a value includes GST, the remark says which basis was assumed and asks for it to be checked.

Every row is marked AI SUGGESTION until an engineer presses Confirm. The sheet is signed by the engineer, not by the model — and 1-Click TQ drafts the query for a bidder whose documents fall short.

9. Start Date D-MM-YYYY)	10. Comp Date (DD-MM-YYYY)	11. Duration (months)	12. WO value in lacs Incl. GST	13. Comp Value of similar nature in lacs Incl. GST	14. Refractory lining is refractory work, but NMDC pellet plant is a mining/metallurgical facility, not a hydrocarbon industry.*	Pending review	

7. Every figure opens the page it came from

Clicking a value in the sheet opens the original PDF at that page — here page 86 of a 97-page dossier — with the value boxed on the document. The panel on the right is the row being evaluated; the chips along the top jump to each field found for this work order. Months after the award, the evidence is still one click away.

8. The value, the quote, and the page it was found on

The app does not assert a figure it cannot show. For each extracted field it keeps the exact text from the document and the page number, and marks whether it is an exact match. Here the work order number in column 3 is backed by "Purchasing Document Number: 9030M24O10/70707XXX" on page 86.

And then it is the engineer's sheet

Nothing in the sheet is final until an engineer confirms it, and any row can be overridden with a reason. Once the sheet is confirmed it exports to the committee's Excel and to a print-ready PDF, and the technical queries to the bidders who fall short are drafted from what is actually missing.

Tender 9070C25XXX, Paradip Refinery. Work orders, values and remarks are as the application produced them; the rows shown are AI suggestions awaiting the evaluating engineer's confirmation. Bidder names and the last digits of reference numbers are masked for circulation.
